Car Accident Severity

- **Introduction/Business Problem**

Every day millions of people are involved in car accidents. If there was an algorithm to predict the severity of an accident, it could enable faster aid to arrive at the scene of the accident. For example, it could help inform police officers what kind of accident and to send the right kind of help.

In this project, we are attempting to predict the severity of vehicle accidents. We utilize the data given by using the number of people and vehicles involved in the accident and what kind of accident had occurred, whether it was only damage to property or damage to passengers as well.
